

2D Ising rare tail $P(|m|)$ ($L=20$, $T=2.6$, $T_c=2.27$); naive floor $|m|=0.93$, WE reaches 0.93

(a) WE reaches beyond naive's hard support floor (shaded: ± 1 s.d. over 20 replicas)

(b) naive: low error then a hard cutoff; WE: finite, graceful degradation
